

French-German Cooperation in Africa
in the field of climate change, food security and
water resources

1/2 June 2015 – Berlin – Embassy of France

**Integrated water research to assess and
secure current and future water resources for
regional development in Sub-Saharan Africa**

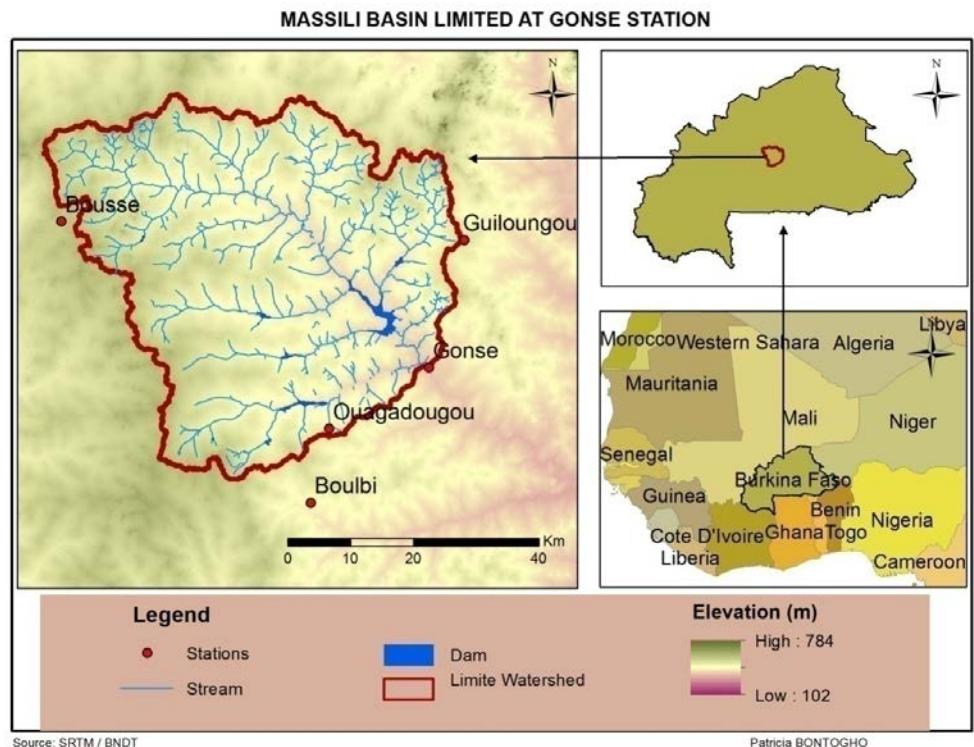

Jörg Helmschrot

University of Hamburg, Biocentre Klein Flottbek
Joerg.helmschrot@uni-hamburg.de; joerg.helmschrot@sasscal.org

Climate change

Motivation

- Awareness of more extremes (droughts and floods) in Western Africa
- Notable land use change takes place (savannah → agricultural fields)
- No existing adaption plans
- Need for adapting land management in accordance to markets and expected changes

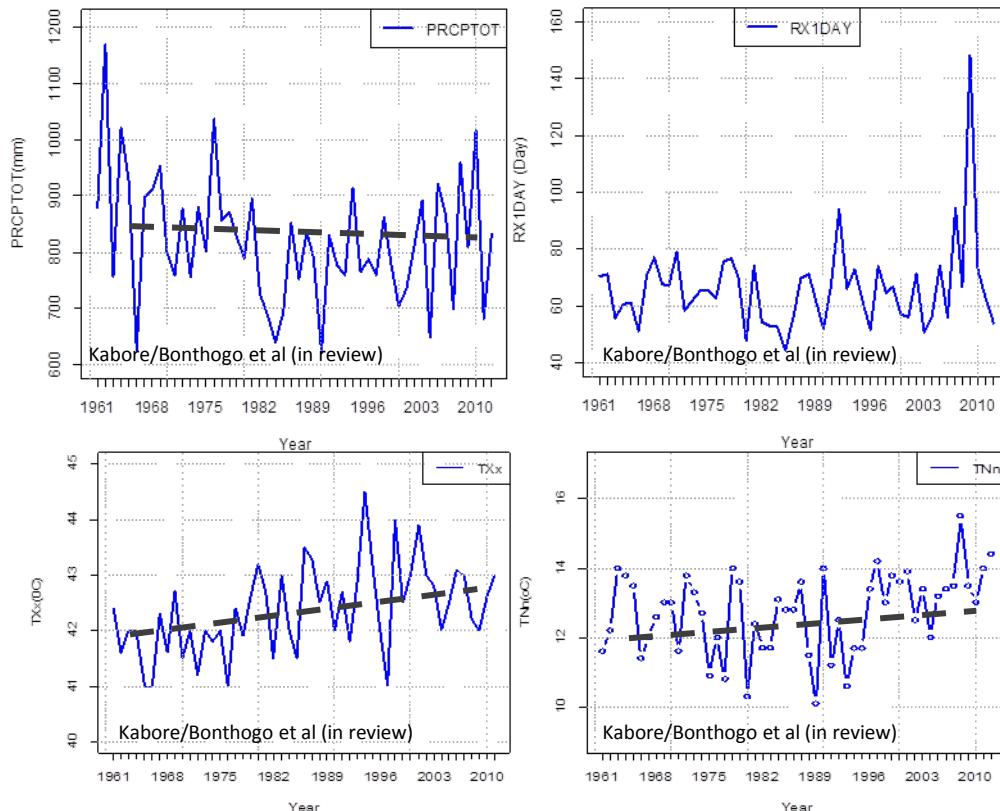

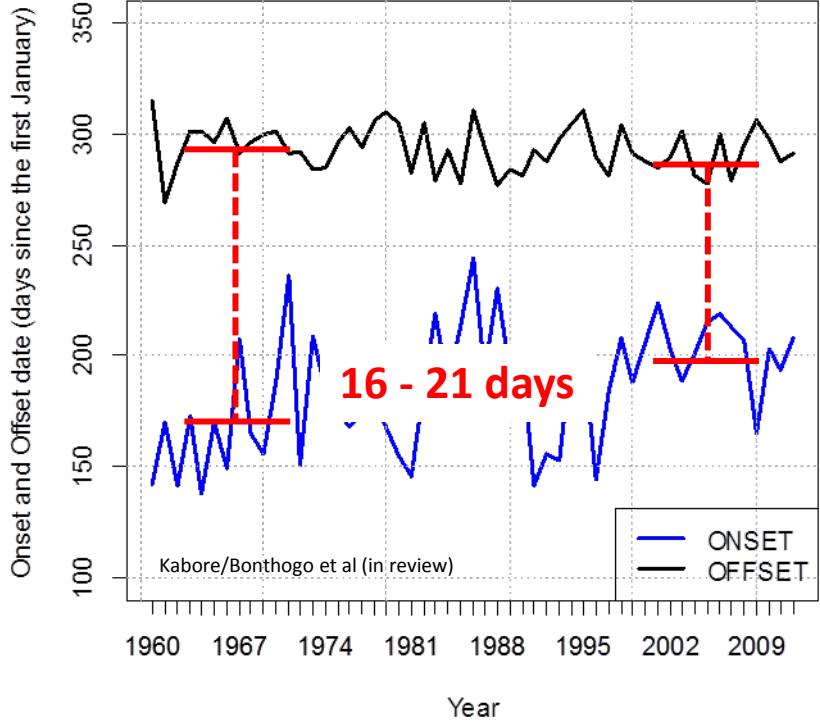

Kabore/Bonthogo et al (in review)

Climate change

Climate change analysis

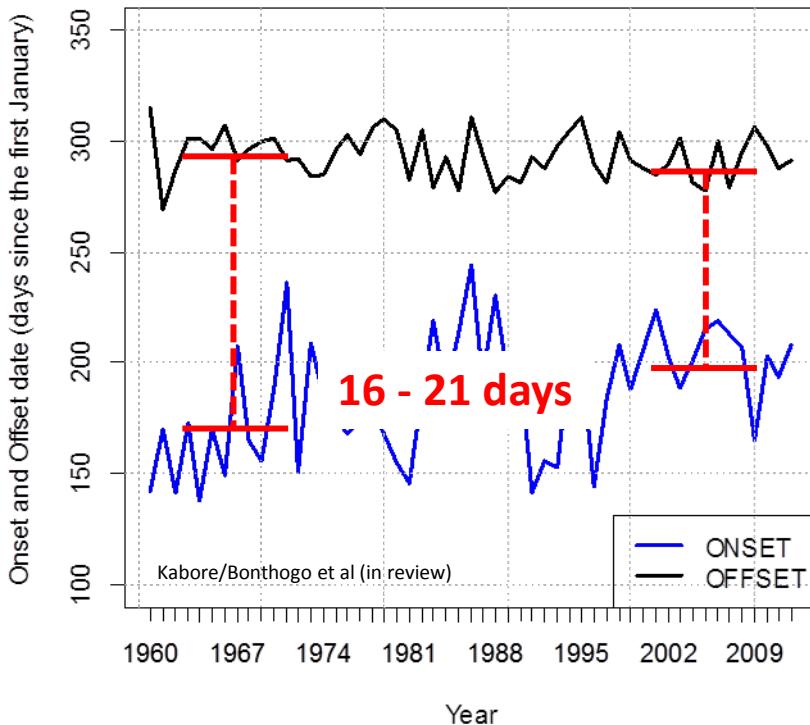

- Delineation of climate indices to assess changes in BF

Climate change

Climate change analysis

- Delineation of climate indices to assess changes in BF

Consequences

- Increase in extreme events (floods/droughts → erosion, yield losses, crop failure)
- Better forecast tools required
- Adaptation needs (agricultural management, water availability)
- Assessment of economic impacts (seed markets)
- Policy advice needed

Dryland Salinity

Salinity is a phenomenon in semiarid areas of Africa, Australia, North and South America occurring when salt is mobilised and transferred through surface/subsurface runoff mechanisms to streams.

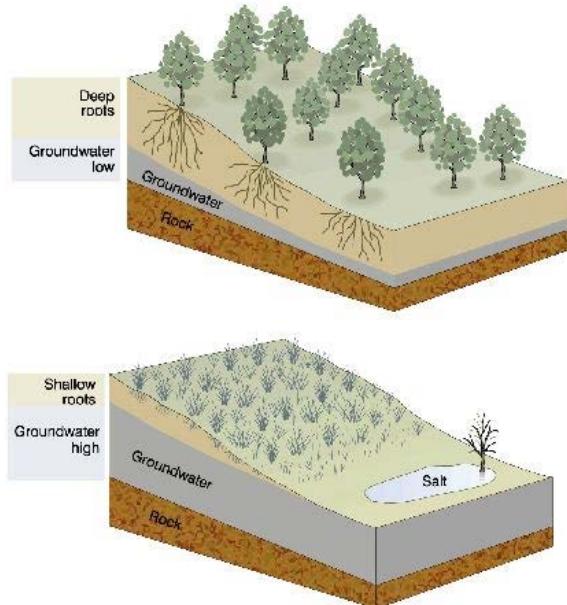

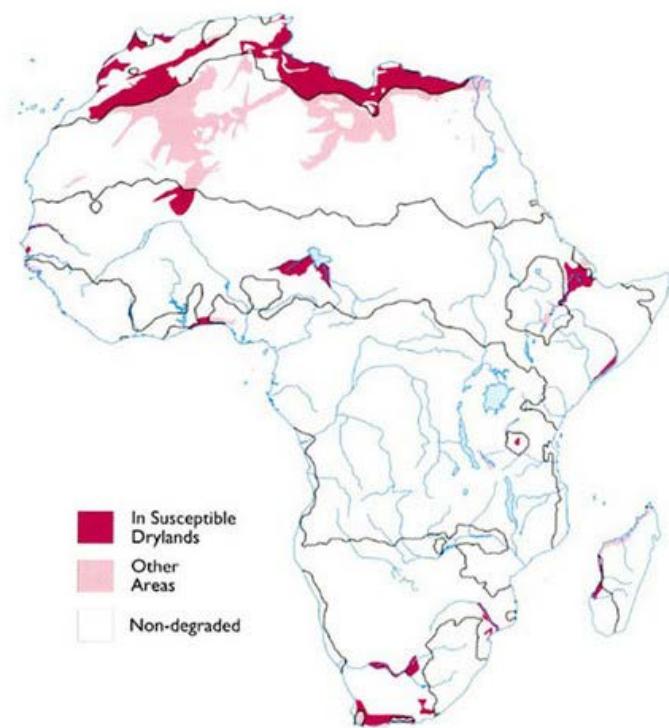

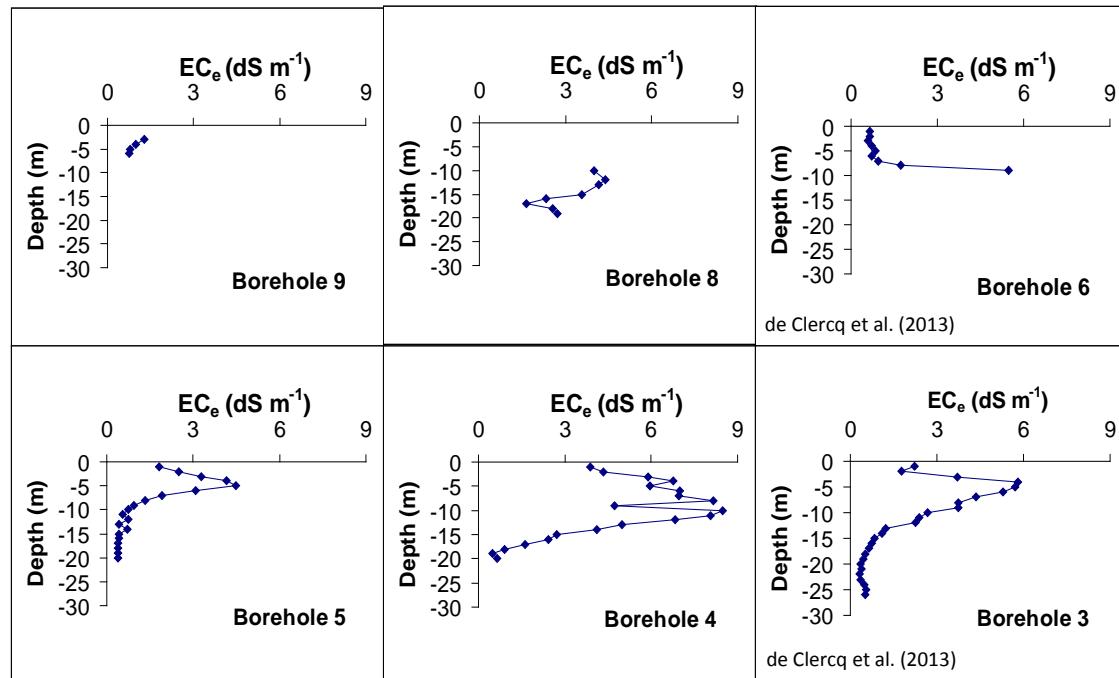

Figure: Salt mobilization resulting from land management change and increasing groundwater levels (DERM, 2004)

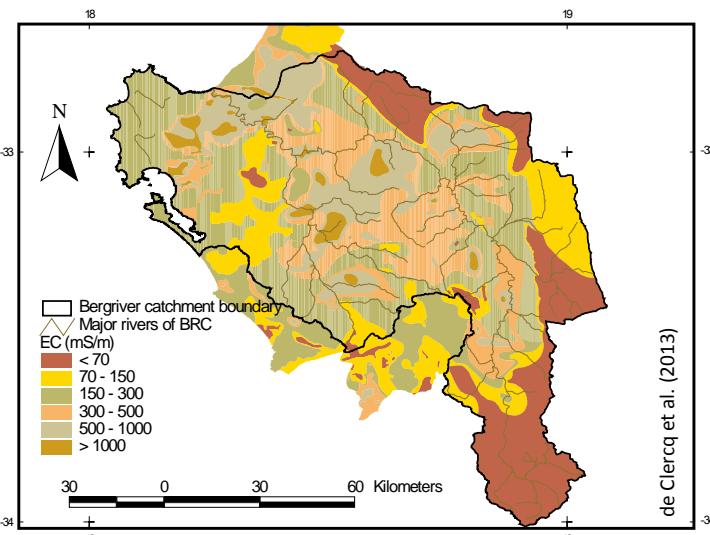

Source: UNEP/ISRIC, CRU/UEA
Approximate equatorial scale 1:81 million

Human impacts: Dryland Salinity

Dryland salinity in the Western Cape, South Africa Case study: Berg and Sandspruit catchments

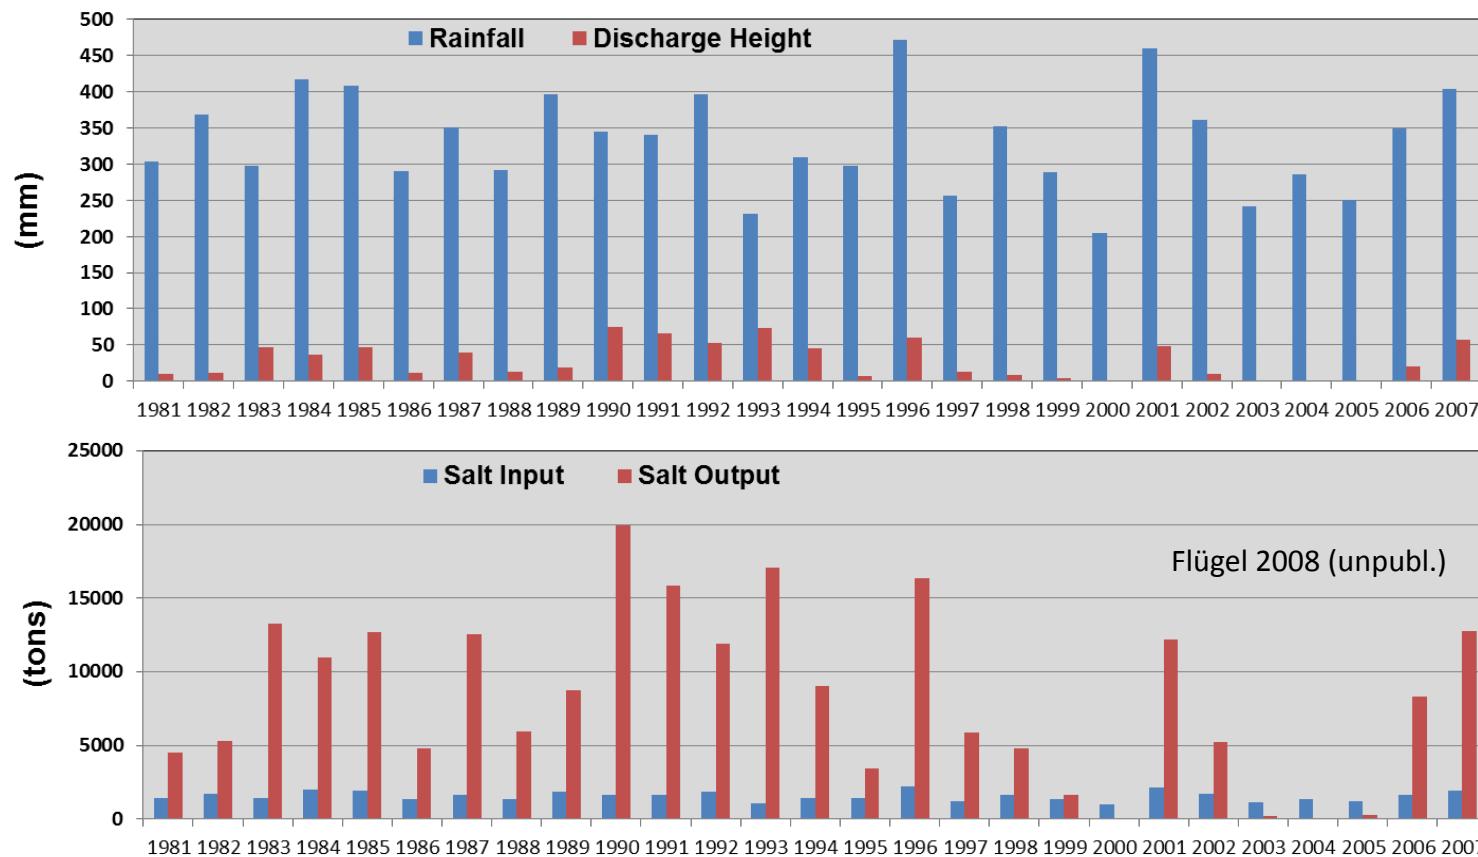

Regolith salinity profiles from saturated paste extracts of samples from 1m sections of six boreholes drilled on the Goedertrouw catchment. For reference purposes an EC_e value of 1 dS m⁻¹ represents a soluble salt content of about 6 tons ha⁻¹.m.

- Notable salt storages in the soils
- Mobilisation through land management change

Dryland Salinity

Salt mobilization in the Western Cape, South Africa
Case study: Sandspruit catchment

Dryland Salinity

Salt mobilization in the Western Cape, South Africa

Case study: Sandspruit catchment

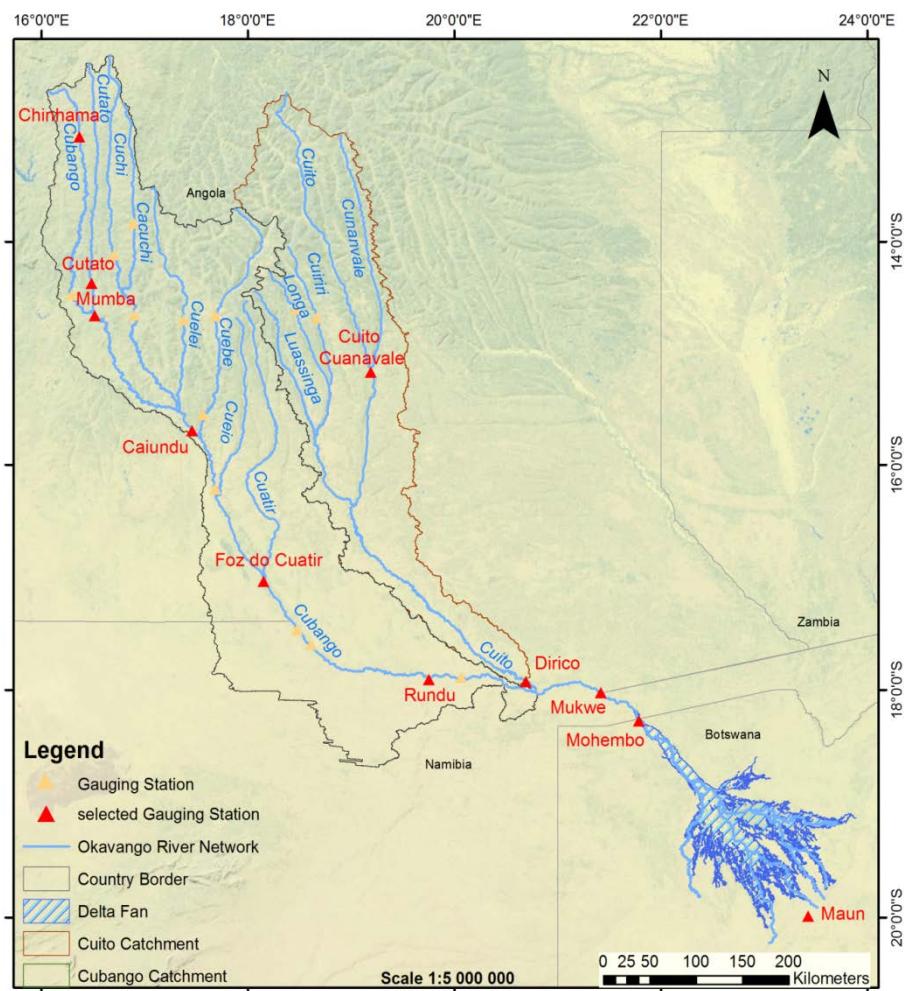

- **Given the actual conditions, salt will be mobilised and laterally transferred for the next several hundred years and thus will dramatically affect water quality in the Western Cape.**
- **Increase of irrigation agriculture may even further reduce water quality (secondary salinity).**

More information: de Clercq, W., Jovanovic, N., Bugan, R., Mashimbye, D., du Toit, T., van Niekerk, A., Ellis, F., Wasserfall, N., Botha, P., Steudel, T., Helmschrot, J., Flugel, W. (2013): Management of human-induced salinisation in the Berg River catchment and development of criteria for regulating agricultural land use in terms of salt generating capacity. Research Report: 1849/1/13. South African Water Research Commission, Pretoria, South Africa.

Climate vs. Human impacts

Motivation

- Analysing the impact of land management change (deforestation) and ongoing expansion of irrigation area – scale-crossing
- Hydrological system analysis
- Runoff generation mechanisms
- Modelling of the hydrological system and change assessments

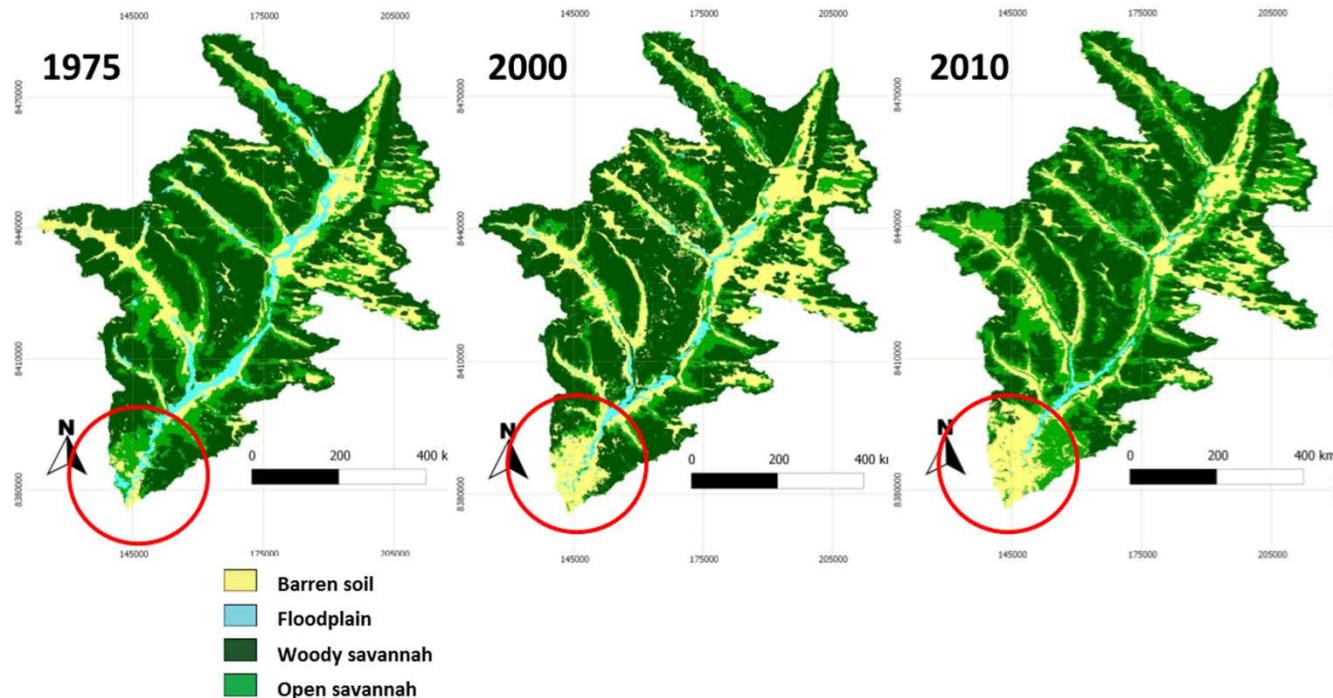

Baumberg et al. 2014, Steudel et al. 2013, Helmschrot et al. 2014

Climate vs. Human impacts

Land use/cover change analysis

- based on the analysis of temporal Landsat images, validated with field data and MODIS
- Increase of urban areas, bush encroachment, soil degradation

Helmschrot et al. 2014

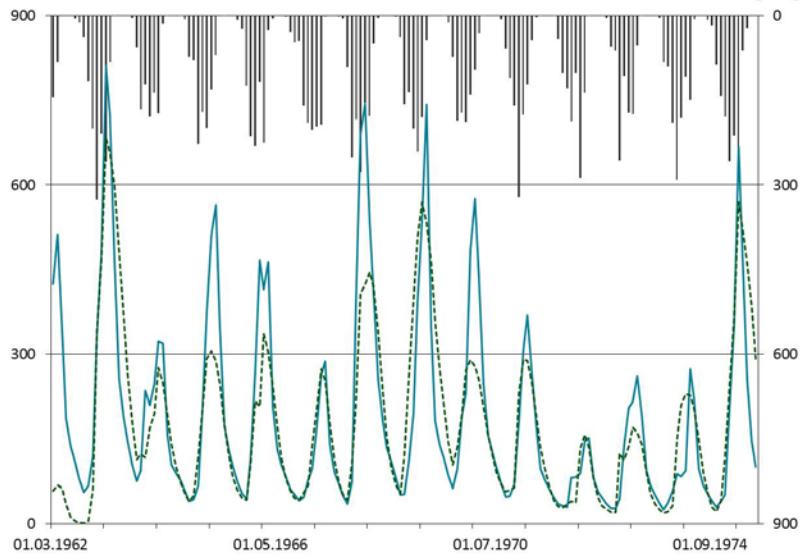

Climate vs. Human impacts

Hydrological modelling and runoff components analysis

Cubango:

rapid runoff, high peak flows, low baseflow, direct runoff)

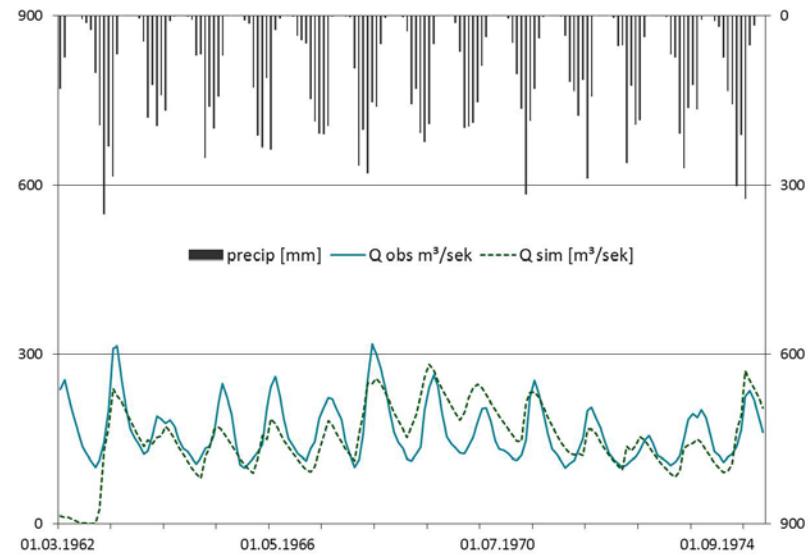

- runoff mostly generated in headwater region
- higher elevation → increasing precipitation
- crystalline bedrock → low infiltration
- steep, v-shaped valleys in headwater region
→ low storage capacity, rapid runoff

Cuito:

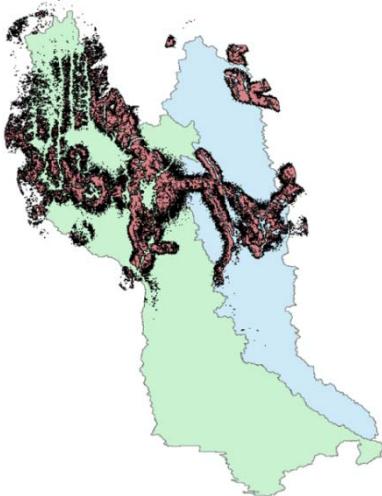

moderate runoff dynamics, lower peaks, higher baseflow, higher water storage

- runoff mostly generated in headwater region
- thick sand layers → infiltration
- gentle slope → decreasing flow velocity
- wide, flat valleys with floodplains, meanders, alluvial swamps → runoff attenuation

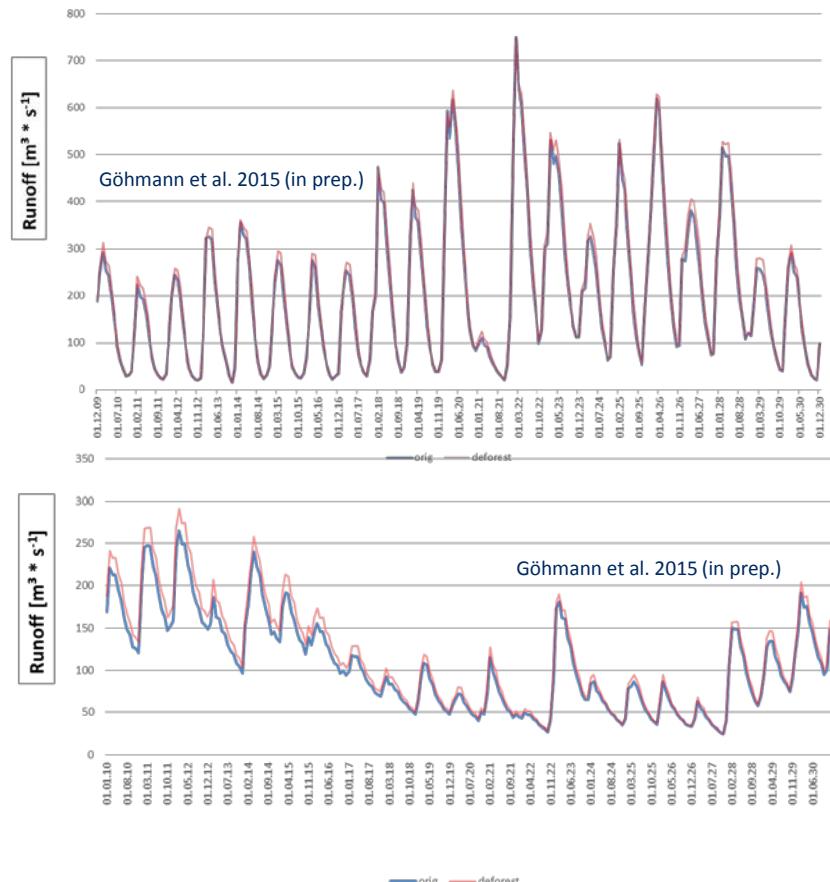

Climate vs. Human impacts

Scenarios – Deforestation, Increasing irrigation

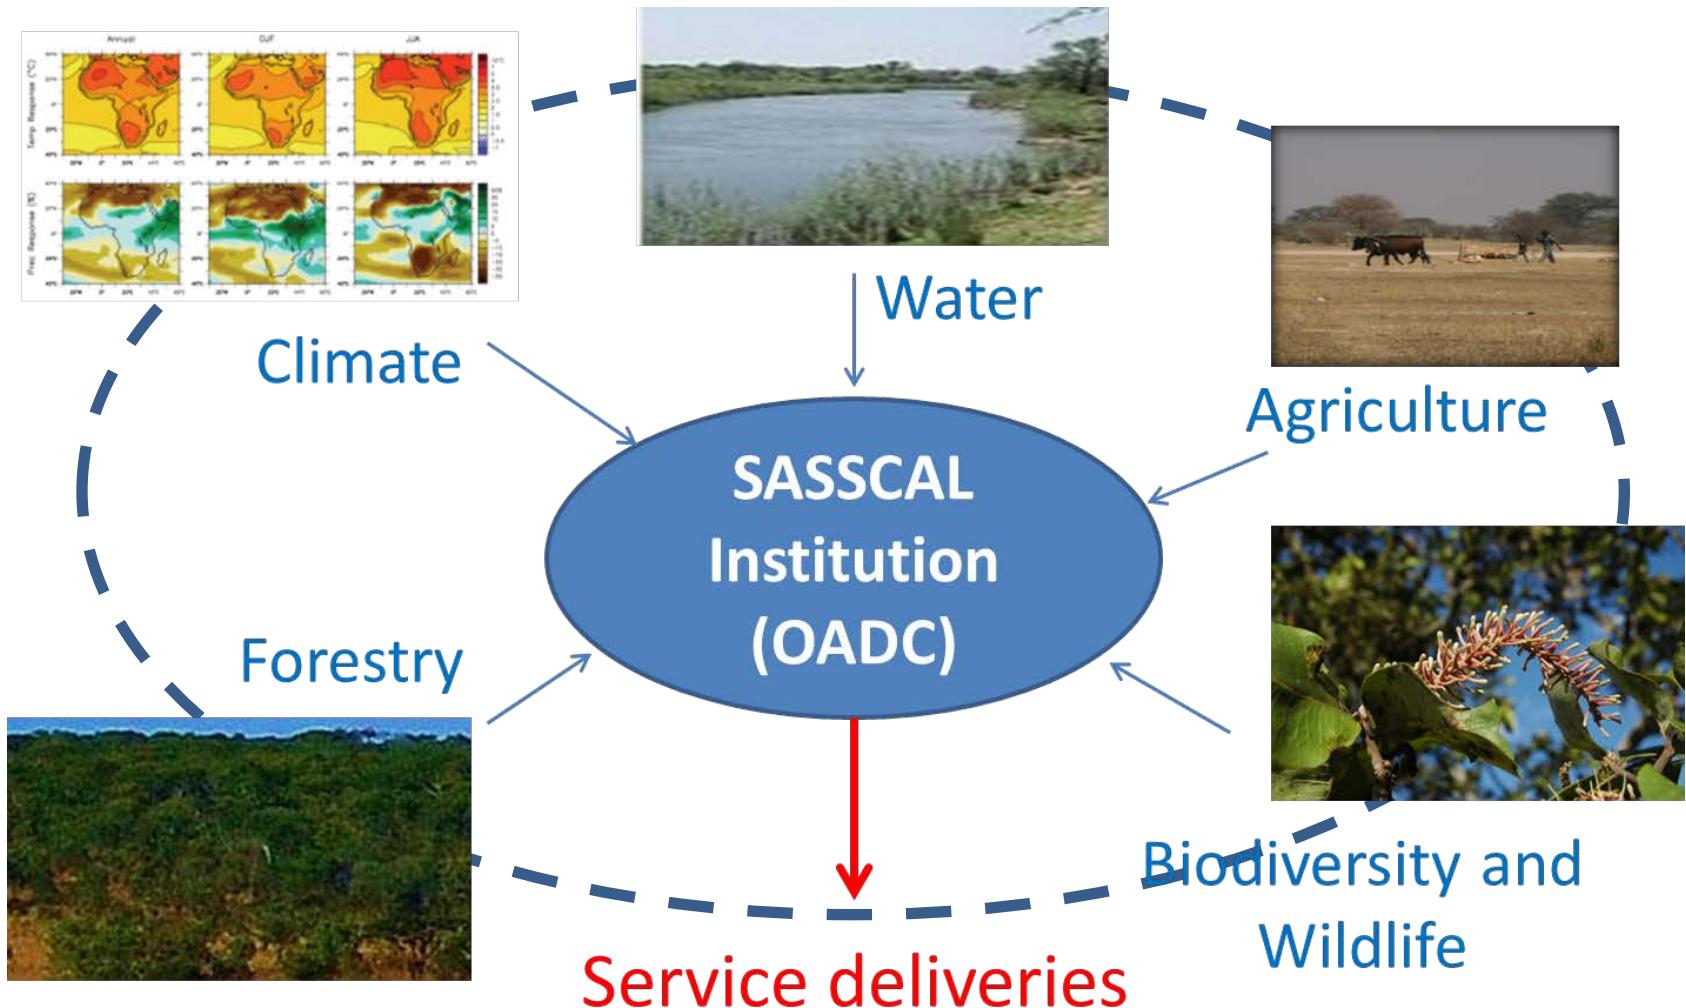

- impact of land management change on Cuito system when irrigation systems will expand → slight increase of runoff peaks
- overarching impact of climate change
- Outlook: impact of reservoirs and groundwater extraction

“SASSCAL is the **REGIONAL** driver for innovation and knowledge exchange to enhance adaptive land use and sustainable economic development in a highly vulnerable region of Southern Africa under global change conditions.”

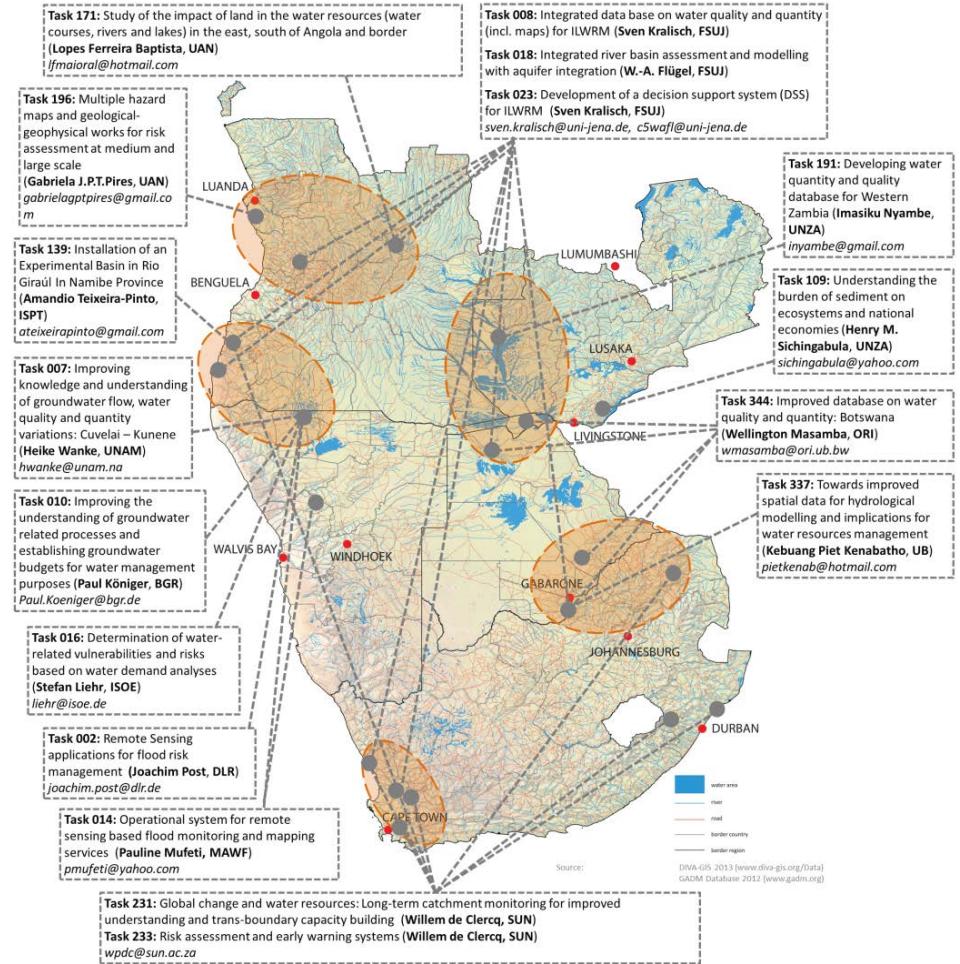

SASSCAL Themes

SASSCAL Status

Thematic area	Angola	Botswana	Germany	Namibia	South Africa	Zambia	Total
Climate	1	3	3	2	1	1	11
Water	3	2	6	3	2	2	17
Forestry	1	2	2	3	1	3	12
Agriculture	3	2	8	3	1	4	21
Biodiversity	4	3	2	6	1	2	18
Cap-Dev	1	2	1	2	0	2	8
Total	13	14	22	19	6	14	88

SASSCAL Water Research

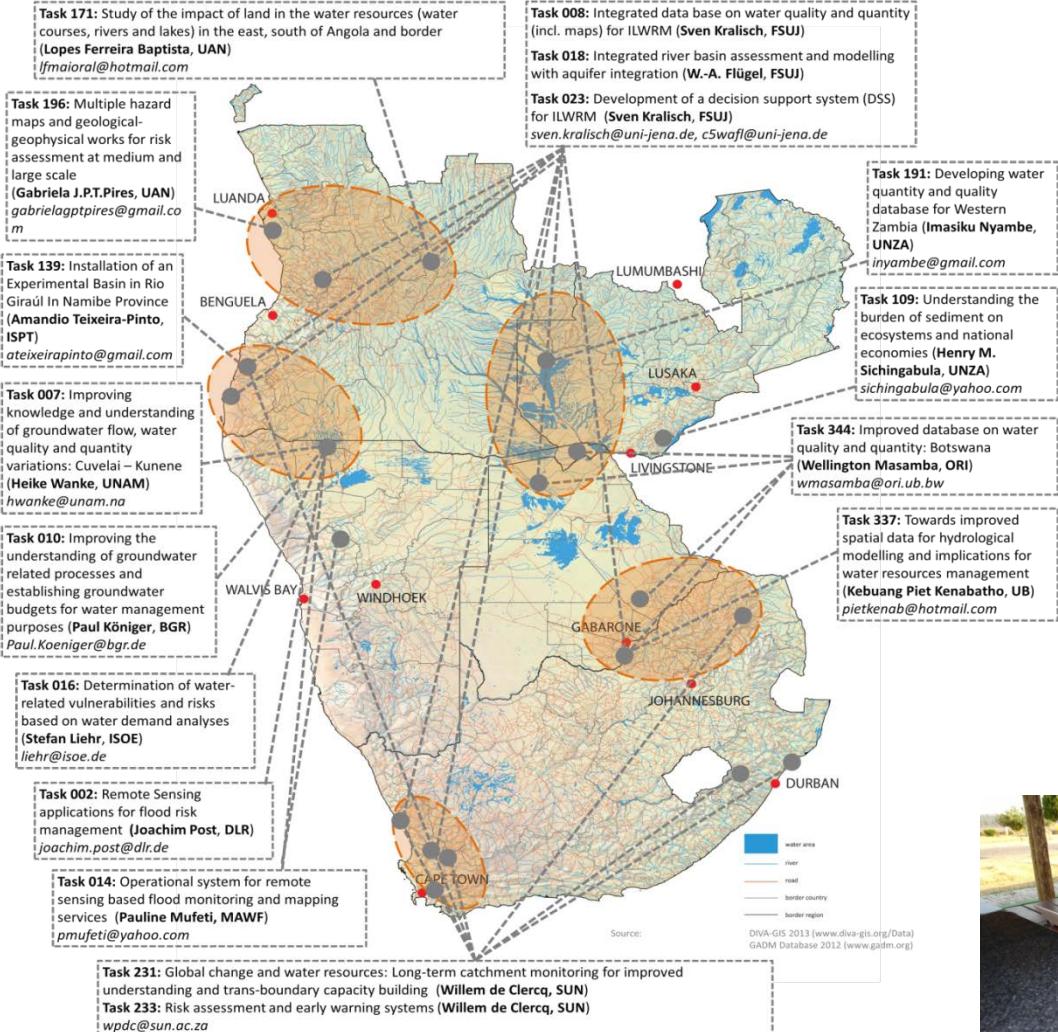

- **Five 'hot spot' areas**
- **Monitoring, analysis, modelling, change assessments**
- **Basic to frontier research**

Integration with research in other thematic fields, e.g.

- Macro-/micro-economic research
- Land cover/use change
- Regional climate and change assessment
- Biodiversity studies (regional)
- Agricultural impact studies (KAZA)
- Socio-economic studies
- Fire impact studies
- Wildlife/Human conflict
- Hydropower potential
- Migration studies, urbanization

SASSCAL Water Research

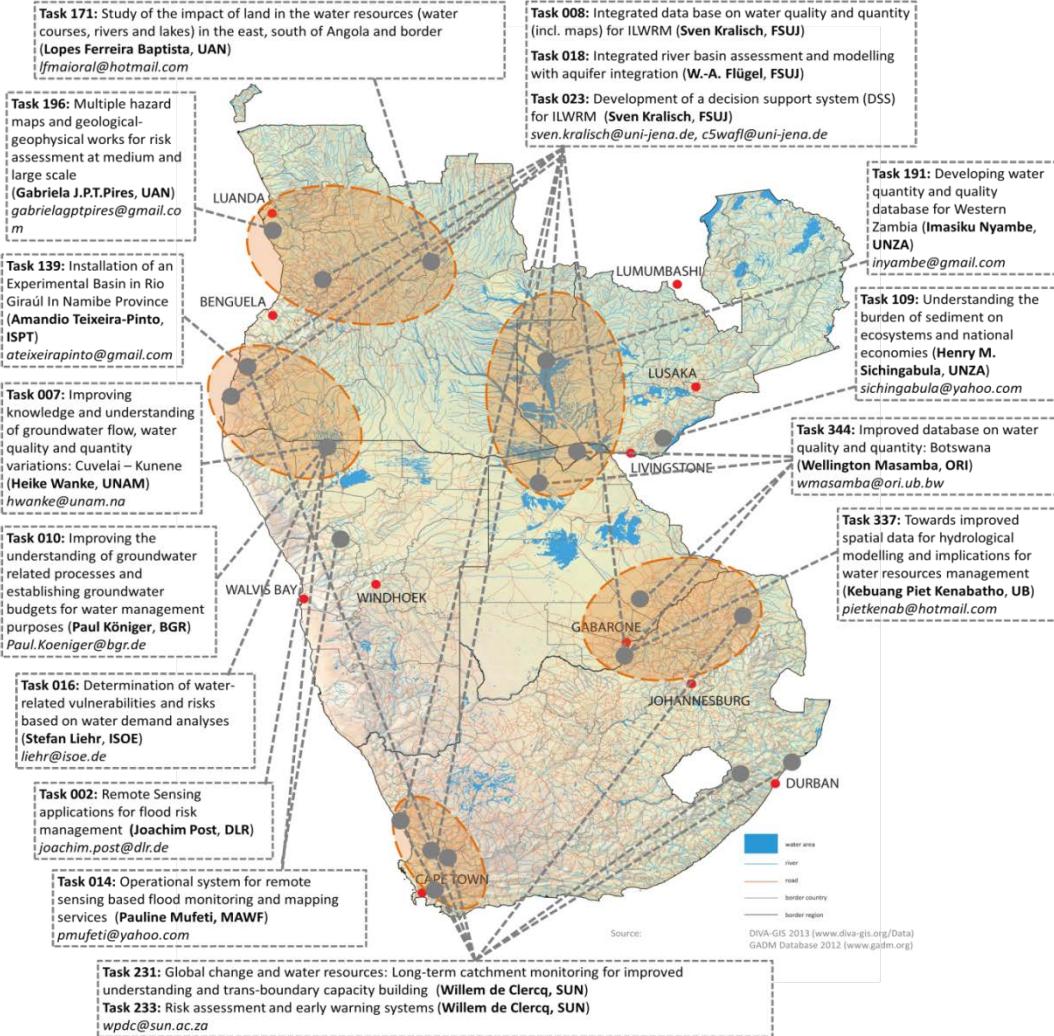

Monitoring

- Technical infrastructure
- Data management
- Advise/decision support
- Training

SASSCAL Water Research

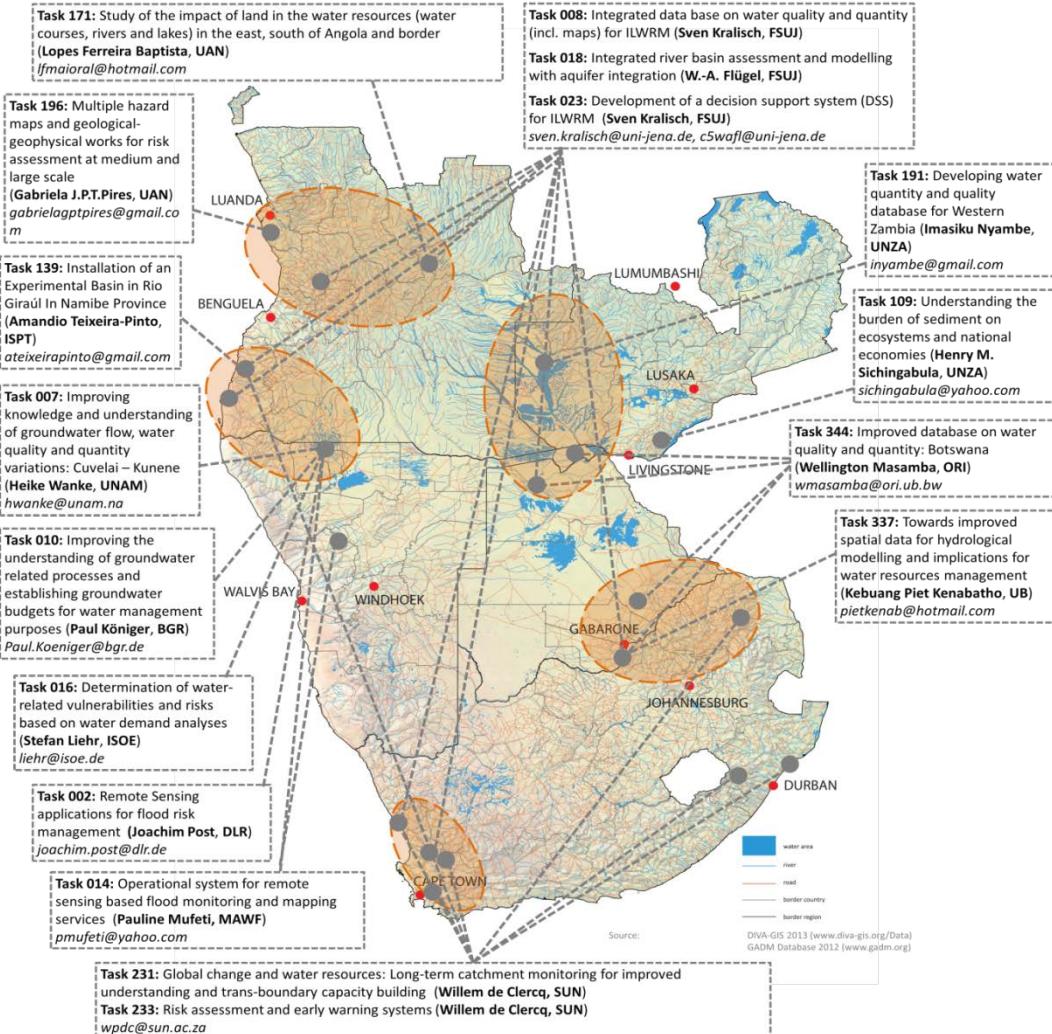

Groundwater

- Origin
- Quantity/quality
- Distribution
- Groundwater use/needs
- Resources assessment
- Management

SASSCAL Water Research

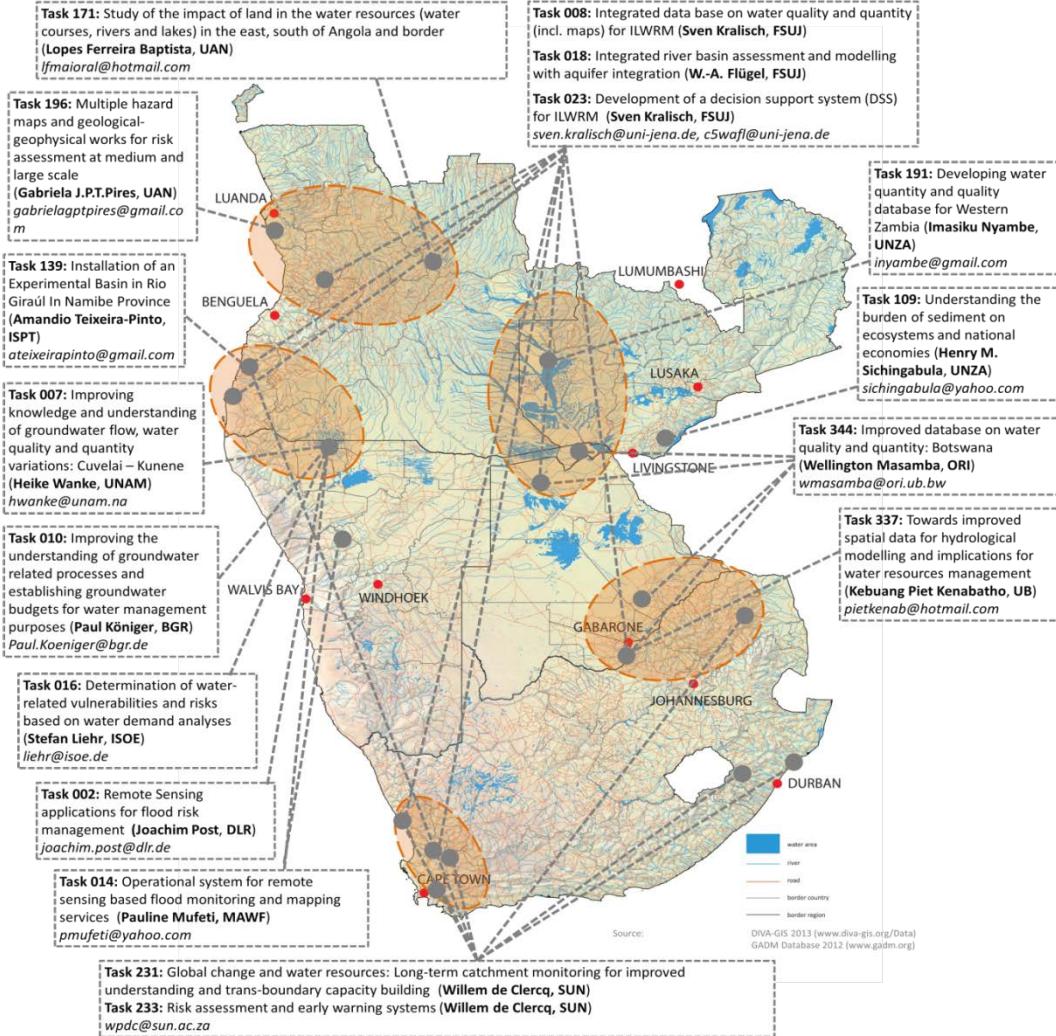

Floods

- Operational mapping (extent, depth)
- Real-time monitoring
- Damage assessment
- Risk mapping
- Forecasting

SASSCAL Water Research

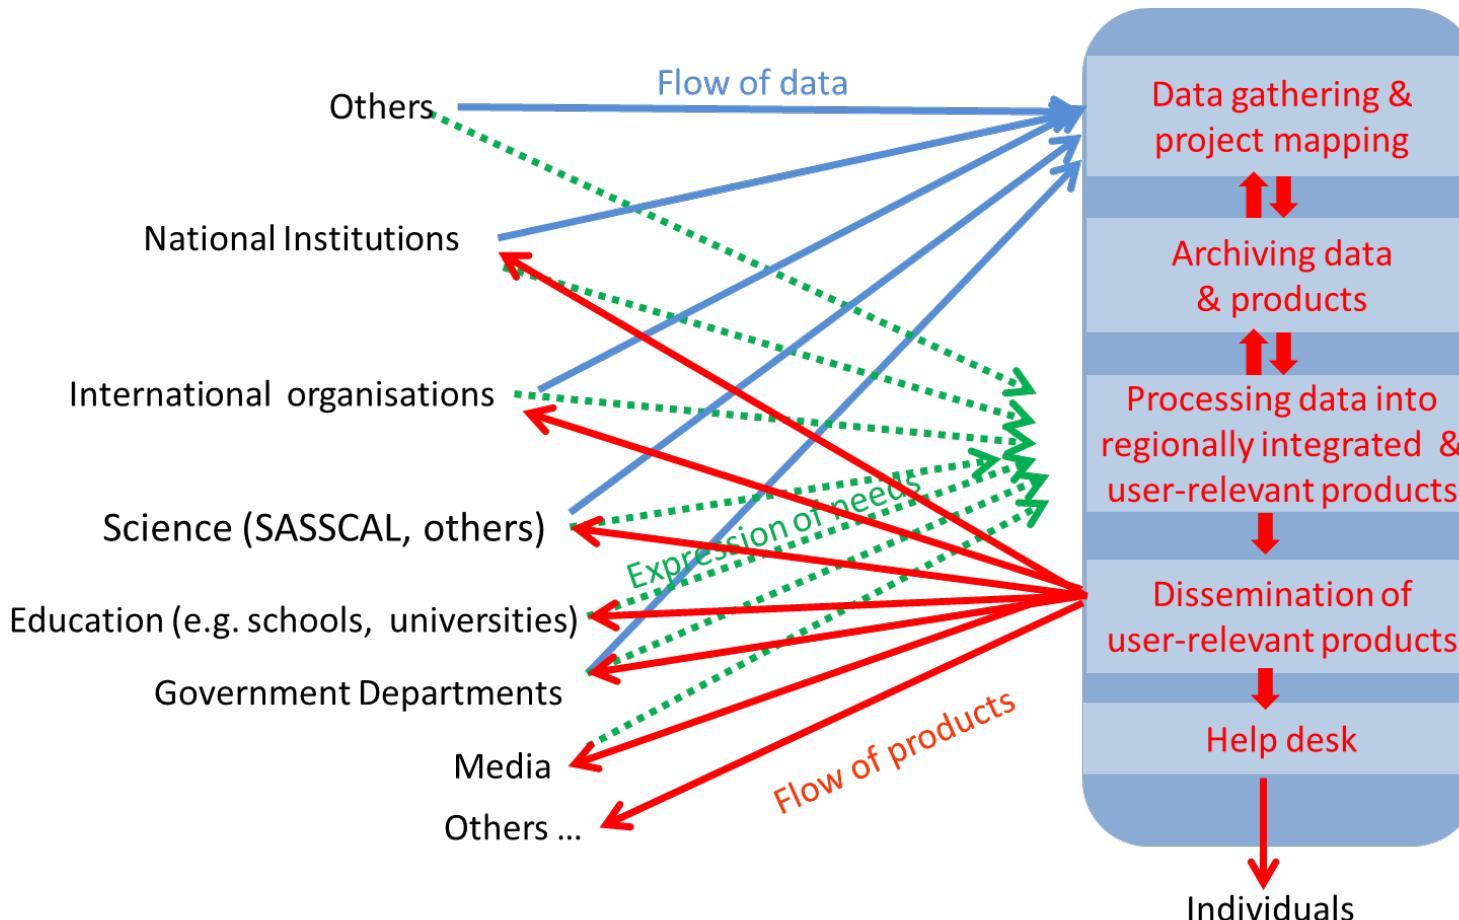

Erosion/Sedimentation/Salinity

- Drivers and processes
- Monitoring
- Impact assessments
- Management (eg. dams)
- Adaptation strategies
- Decision support/training

Open Access Data Centre

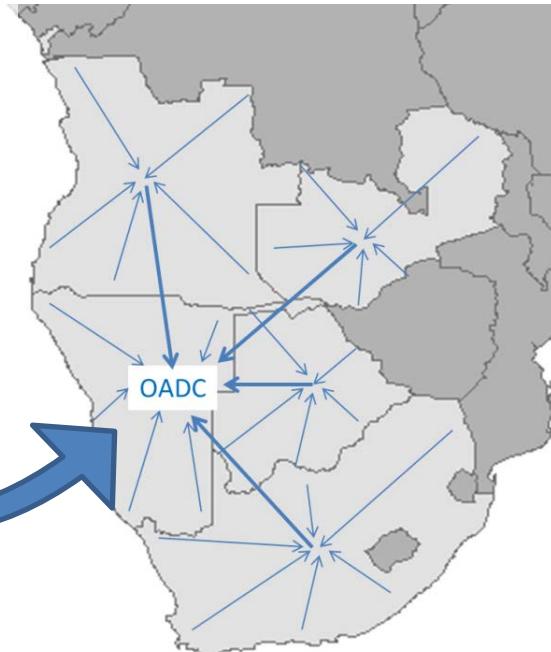

Open Access Data Centre

Collation of existing and newly generated data

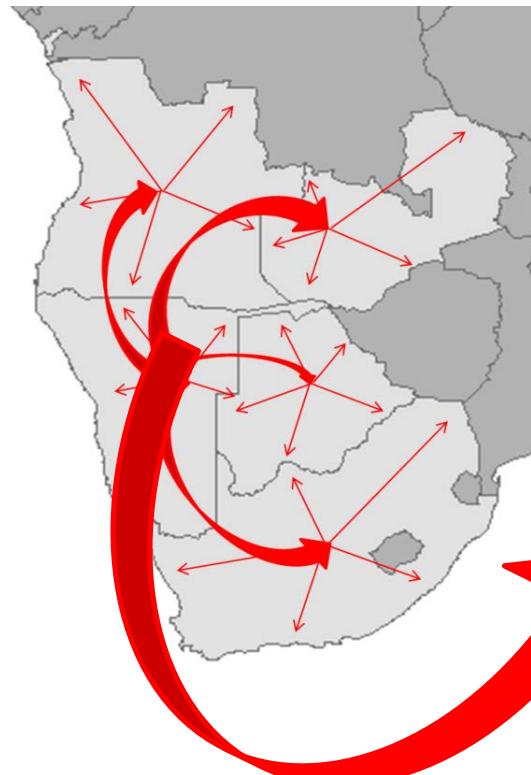

(e.g. national soil & forest maps, catchment information, station data ...)

- Existing archives (OBIS, GRDC ...)
- cooperation with global initiatives (FAO, UNEP, NASA, USGS ...)

Distribution of regionally integrated data

(e.g. regional map on soil or forest resources, rainfall pattern, climate scenarios...)

Local/national/region/ international

- policy makers
- research institutions
- strategic partners
- public

SASSCAL Services

Open Access Data Centre

Products/Services: SASSCAL WeatherNet, Plant Photo Guide, SASSCAL IS, ObservationNet, BIOTABase, Faunal Photo Guide (in dev.)
Data: RS products (land cover/change, fire risk), climate data (re-analysis, projections) ...

The screenshot shows a grid of weather station icons and data for various locations. A central box displays current temperatures and precipitation levels for Dama, Cacuso, Alto Dondo, and Maconda. Below this, a section for new weather stations online lists stations like Coetzer, Pni Boer, and Tundela Observatory.

This page provides an overview of observatories across Namibia. It includes a search function and a grid of thumbnail images for various observatories like Charalai, Disaipwe, Durusas, Gobabeb, Gobabekile, Goribane, Hobahe, Kavine, and Nambala.

The dashboard features a central circular icon with labels for ts (time series), map (maps), meta (metadata), doc (documents), xss (cross-system services), and sim (models). To the left, there's a sidebar with links for person & org, study site, observation, station, time series data, document, and other data. The main content area shows a list of datasets and their details.

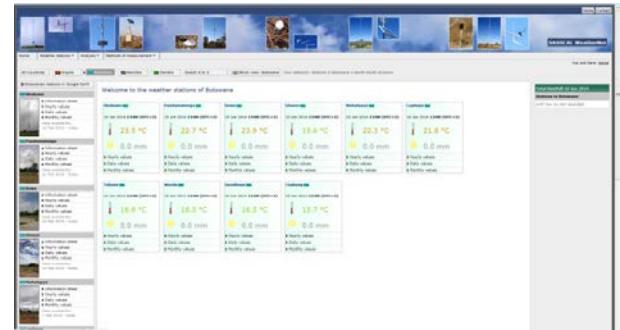

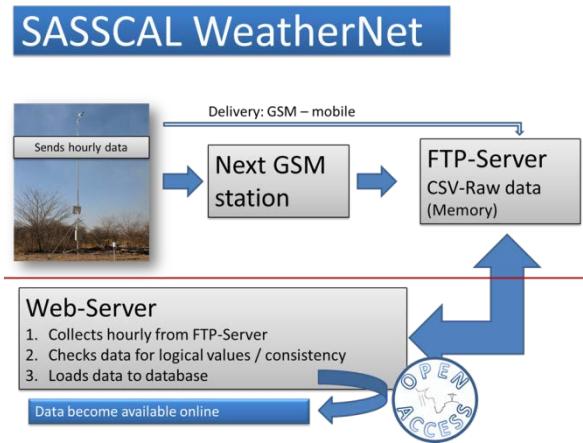

This botanical guide features a header with a plant photo collage and navigation links for Home, Search by Family, and Login. The main content area is titled "Photo Guide to Plants of Southern Africa" and includes sections for "What are you looking for?", "Only species with photos", and "Reset". It also shows visitor statistics and a sidebar for "Cooperating institutions" like BOTA and SANBI.

The interface includes tabs for "User", "Role", "Group", and "Database". It displays statistics such as "17669 photos" and "2533 species". A "Photo Guide to Plants of Southern Africa" link is visible at the top.

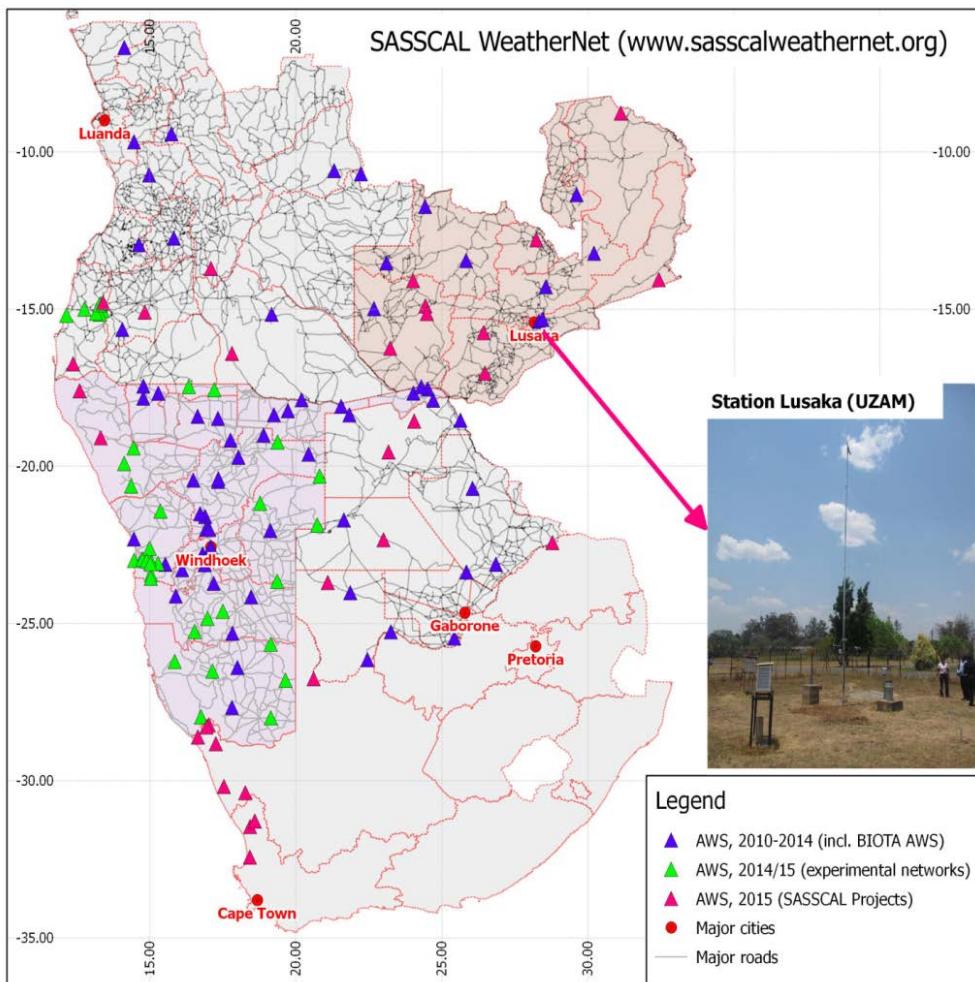

SASSCAL WeatherNet

- contribution to national weather monitoring efforts
- support for research tasks
- May 2015: 105+ AWS in operation and online
- 8 standard variables + optional var's
- WMO standards and registration
- Nearly real time availability on www.sasscalweathernet.org
- Aug 2015: 147 AWS in operation

Conclusion

Integrated Research

- Interdisciplinary research addressing a wide range of global change aspects
- Linking basic research (observation & system understanding) and frontier science (modelling and (change) assessments)
- Improving data situation (incl. data rescue), developing innovative tools and new knowledge

Services and Capacity Development

- Stakeholder-oriented services (OADC, climate information, data rescue, vegetation maps, policy briefs)
- Technical infrastructure and human resources development

SASSCAL: Platform to link integrated research, service provision and capacity development for problem-oriented solutions according to regional needs

Thank you! Merci beaucoup! Danke!
